Chapter 10

ENTHALPY OF VAPORIZATION AT BOILING POINT – INORGANIC COMPOUNDS

Carl L. Yaws and Prashant Bahadur
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 10 for enthalpy of vaporization at boiling point. The tabulation is arranged by alphabetical order (Ag, Al, Ar, ..., Zr) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. The next columns provides the normal boiling point and the enthalpy of vaporization at the boiling point. The last column gives the code for the tabulation.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-32). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2), Daubert and Danner (3), Lange's Handbook (11-12), web sites (15-17), and Yaws (18-32) were used extensively for enthalpy of vaporization. The Kistiakowsky rule (11) and Riedel method (11) were primarily used for estimates of enthalpy of vaporization at the boiling point.

Example

In an engineering analysis, the enthalpy of vaporization is needed for ammonia (NH3) at the boiling point temperature of 239.72 K. Determine the enthalpy of vaporization of ammonia at the boiling point.

Inspection of the tabulation provides the following:

HVAP = 23.261 kjoule/mol

Chapter 11

ENTHALPY OF FUSION AT FREEZING POINT – ORGANIC COMPOUNDS

Carl L. Yaws and Sy-Chyi Lin
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 11 for enthalpy of fusion at freezing point. The tabulation is arranged by carbon number (C, C2, C3, ...) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. The next columns provides the freezing point and the enthalpy of fusion at the freezing point. The last column gives the code for the tabulation.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-21). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (2-3); Daubert and Danner (4); Domalski and Hearing (6); and Yaws (18-21) were used extensively. Estimates for enthalpy of fusion at the freezing point were primarily based on methods of Bondi (1, entropy), Joback (8, group contribution), and Chickos et al (11, group contribution).

Example

In an engineering analysis, the enthalpy of fusion is needed for carbon tetrachloride (CCl4) at the freezing point temperature of 250.33 K. Determine the enthalpy of fusion of carbon tetrachloride at the freezing point.

Inspection of the tabulation provides the following:

HFUS = 2.560 kjoule/mol

Chapter 12

ENTHALPY OF FUSION AT FREEZING POINT – INORGANIC COMPOUNDS

Carl L. Yaws and Sy-Chyi Lin
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 12 for enthalpy of fusion at freezing point. The tabulation is arranged by alphabetical order (Ag, Al, Ar, ..., Zr) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. The next columns provides the freezing point and the enthalpy of fusion at the freezing point. The last column gives the code for the tabulation.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-13). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2), Daubert and Danner (3), Lange's Handbook (6-7), web sites (8-10), and Yaws (11-12) were used extensively for enthalpy of fusion.

Example

In an engineering analysis, the enthalpy of fusion is needed for ammonia (NH3) at the freezing point temperature of 195.41 K. Determine the enthalpy of fusion of ammonia at the freezing point.

Inspection of the tabulation provides the following:

HFUS = 5.657 kjoule/mol

Chapter 13

SOLUBILITY PARAMETER AND LIQUID VOLUME – ORGANIC COMPOUNDS

Carl L. Yaws and K. Y. Li
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 13. The tabulation is arranged by carbon number (C, C2, C3, ...) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for solubility parameter and liquid volume are given in the adjacent columns. The next column provides the code for the tabulation.

For the tabulation, the results for solubility parameter are ascertained from heat of vaporization and liquid volume

$$\text{sol par} = [\ (\Delta H_{vap} - RT) / v\ ]^{0.5} \qquad (13)$$

where sol par = solubility parameter, $(\text{joule/cm}^3)^{0.5}$
ΔH_{vap} = enthalpy of vaporization, joule/mol
R = universal gas constant, joule/(mol K)
T = temperature, K
v = liquid volume, cm^3/mol

For compounds that are liquids at ambient conditions, the values apply at 25 C. For compounds that are gases at ambient conditions, the values apply at the normal boiling point temperature. For compounds that are solids at ambient conditions, the values apply at the melting point temperature.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-33). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2), Daubert and Danner (3), TRC (11-12), and Yaws (15-33) were used extensively. Estimates for enthalpy of vaporization at the boiling point were primarily based on the Kistiakowsky rule (9) and Riedel method (9). The Joback method (9) was used for estimating critical temperature. Estimates of liquid density were primarily based on Schroeder correlation (9, group contribution), Le Bas method (9, group contribution), and Tyn-Calus equation (9, critical volume). Liquid volume was ascertained from molecular weight and liquid density (molecular weight/density).

Example

In an engineering analysis, the solubility parameter and liquid volume are needed for carbon tetrachloride (CCl4). Determine the solubility parameter and liquid volume for carbon tetrachloride.

Inspection of the tabulation yields:

sol par = 17.571 $(\text{joule/cm}^3)^{0.5}$

v = 97.171 cm^3/mol

Chapter 14

SOLUBILITY PARAMETER AND LIQUID VOLUME – INORGANIC COMPOUNDS

Carl L. Yaws and K. Y. Li
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 14. The tabulation is arranged by alphabetical order (Ag, Al, Ar, ..., Zr) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for solubility parameter and liquid volume are given in the adjacent columns. The next column provides the code for the tabulation.

For the tabulation, the results for solubility parameter are ascertained from heat of vaporization and liquid volume

$$\text{sol par} = [\ (\Delta H_{vap} - RT) / v\ ]^{0.5} \qquad (14)$$

where sol par = solubility parameter, $(\text{joule/cm}^3)^{0.5}$
ΔH_{vap} = enthalpy of vaporization, joule/mol
R = universal gas constant, joule/(mol K)
T = temperature, K
v = liquid volume, cm^3/mol

For compounds that are liquids at ambient conditions, the values apply at 25 C. For compounds that are gases at ambient conditions, the values apply at the normal boiling point temperature. For compounds that are solids at ambient conditions, the values apply at the melting point temperature.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-36). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2); Daubert and Danner (3); Janz, Ward, and Reeves (7); Landolt and Bornstein (8); Lange's Handbook (9-10), Vargaftik(18); web sites (19-21), and Yaws (22-36) were used extensively. The Kistiakowsky rule (14) and Riedel method (14) were primarily used for estimates of enthalpy of vaporization at the boiling point. Estimates of liquid density were primarily based on Schroeder correlation (14, group contribution), Le Bas method (14, group contribution), and Tyn-Calus equation (14, critical volume). Liquid volume was ascertained from molecular weight and liquid density (molecular weight/density).

For the inorganic compounds, most of the data for enthalpy of vaporization and liquid density are only available for compounds with low boiling points and low melting points. The data available for compounds with high normal boiling points and high melting points are very meager. In the absence of data, the estimates should be considered rough approximations for those compounds with high boiling points and high melting points.

Example

In an engineering analysis, the solubility parameter and liquid volume are needed for silicon tetrachloride (SiCl4). Determine the solubility parameter and liquid volume for silicon tetrachloride.

Inspection of the tabulation yields:

sol par = 15.342 $(\text{joule/cm}^3)^{0.5}$

v = 115.581 cm^3/mol
